Miniconference Morning Program

9:00	Overview of the Ptolemy project	Edward A. Lee
9:20	The Ptolemy kernel	Edward A. Lee
9:40	Design Methodology Management	Asawaree Kalavade
10:10	Symbolic Computation in System Simulation and Design	Brian Evans
10:30	Break	
10:50	VHDL Code Generation for Simulation and Synthesis	Mike Williamson
11:10	Optimization Issues in Embedded Software Synthesis	Shuvra Bhattacharyya
11:40	Combined Code and Data Memory Minimization	Praveen Murthy
12:00	Lunch	

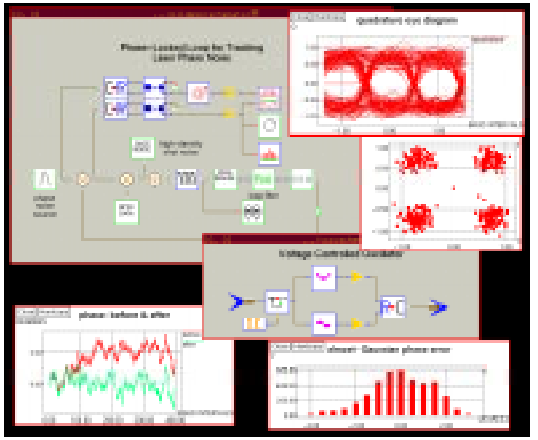
Miniconference Afternoon Program

1:00	Parallel Implementation	S. Sriram
1:20	Real-Time Prototyping	José Pino
1:40	Mixing Dataflow with Control	Wan-Teh Chang
2:10	Break	
2:30	An introduction to a Mathematical Model of Dataflow	Tom Parks
2:50	The Process Networks Domain	Tom Parks
3:00	Application to the Infopad Project	Sam Sheng
3:20	NetPlan: A Network Planning Tool on Ptolemy	Zhigang Qin
3:40	Application to Distributed Telecommunications Services	William Li
4:00	Application to Video Networking	Allen Lao
4:20	Preview of Ptolemy versions 0.5.2 and 0.6	Alan Kamas
5:00	Adjourn	

System-Level Design of Signal Processing Systems

Ptolemy Research

- Design complexity management.
- Visual, algorithm-level system design.
- Formal methods for dataflow systems.
- Programming language semantics.
- Software and hardware synthesis.
- Parallel architectures, partitioning, and scheduling.

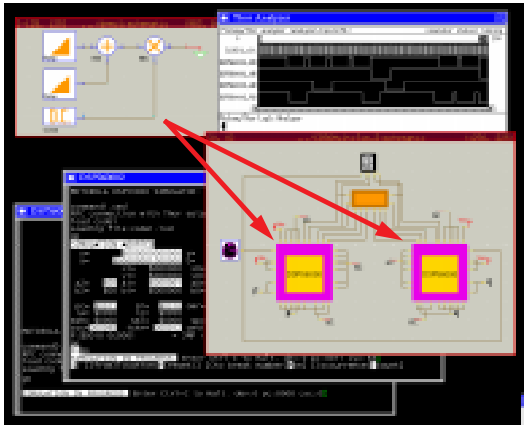


This highly multidisciplinary project addresses system-level design and implementation of signal processing systems.

Implementation of Signal Processing Systems

Hardware/ Software Synthesis

- Design of heterogeneous embedded systems.
- Real-time systems.
- Synthesis of software from dataflow graphs.
- System-level hardware design.
- Cosimulation of hardware and software.
- Codesign of hardware and software.

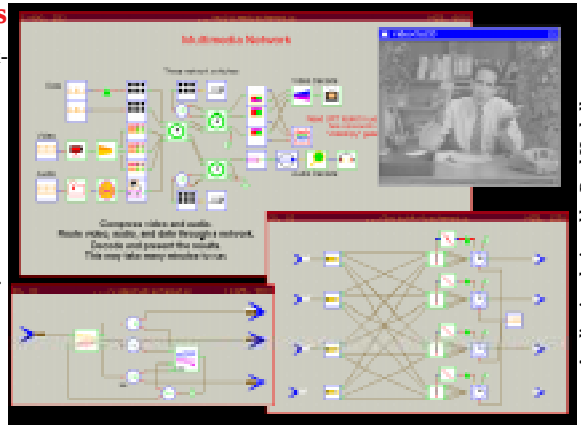


The design philosophy in Ptolemy is heterogeneous, allowing for effective use of specialized design tools within a general system-level design environment.

Heterogeneous Modeling and Design

Key Principles

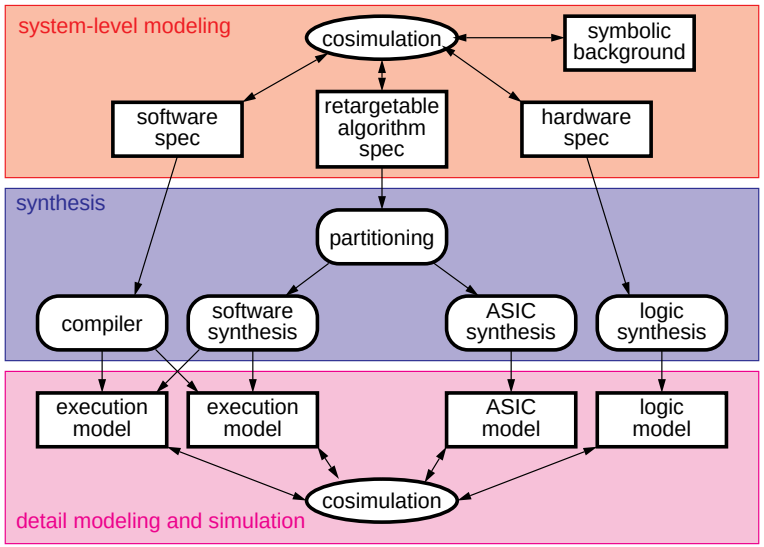
- Extensible, object-oriented kernel.
- No model of computation is implemented in the kernel.
- Models of computation are implemented in modular *domains*.
- A domain interacts with another without knowing its semantics.



Application designed by Paul Haskell

Multiple models of computation may be used in the same system. Here, dataflow is used for signal processing, while a timed discrete-event system models a communication network.

Heterogeneity in System-Level Design



Ptolemy as a Tool and as a Laboratory

Ptolemy is

- **Extensible**
- **Publicly available**
- **An open architecture**
- **Object-oriented**

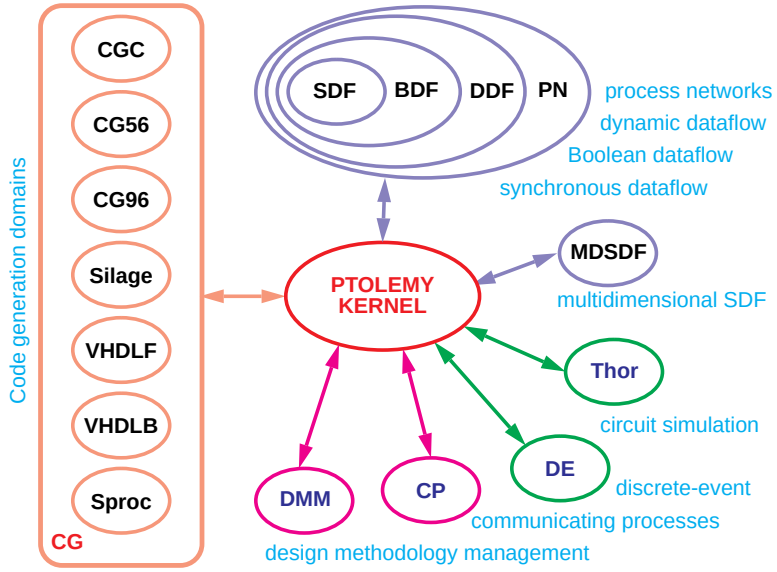
Allows for experiments with:

- **Models of computation**
- **Domain-specific tools**
- **Design methodology**
- **Software synthesis**
- **Hardware synthesis**
- **Cosimulation**

Rationale for heterogeneity: specialized models are

- **More useful to the system-level designer**
- **More amenable to hardware and software synthesis**
- **More amenab le to formal methods**

Domains in Ptolemy



Major Activities

- **Formal methods**
  - **Dataflow** (process networks, synchronous, Boolean, multidimensional, ...)
  - **Control** (hierarchical FSMs, Esterel, synchronous languages, ...)
  - **Partitioning and scheduling of dataflow graphs** (optimize IPC, memory, ...)
  - **Programming languages** (higher-order functions, polymorphism, ...)
- **Algorithm-level design methodology**
  - **Mixing models of computation** (discrete-event, FSMs, dataflow, imperative, ...)
  - **Animation and visualization** (Tcl/Tk, Matlab, xv, ...)
  - **Mixing domain-specific tools** (filter design, Matlab, Mathematica, ...)
  - **Visual programming** (dataflow, FSMs, regularity, recursive, functional, ...)
- **System-level design methodology**
  - **Synthesis of embedded software** (high-level, assembly, ...)
  - **Design complexity management** (data, tool, flow, methodology, ...)
  - **Hardware/software codesign** (DesignMaker, GCLP partitioning, ...)
  - **Architecture design and performance modeling** (OT principle, VHDL, ...)

Major Contributions in Dataflow Modeling

- **Compile-time scheduling of *synchronous dataflow* graphs with optimized partitioning and memory utilization.**
- **Specification of the *Boolean dataflow (BDF) model*, which is Turing complete.**
- **Proof that the existence of a finite complete cycle and a bounded memory implementation for BDF is *undecidable*.**
- ***Heuristics* for constructing finite complete cycles and bounded memory schedules most of the time.**
- ***Multidimensional* generalization to dataflow models.**
- ***Process network* model generalization to dataflow.**
- ***Visual programming* formulation and use of *higher-order functions*.**

Where to From Here?

- **Real-time scalable computing.**
- **Scalable embedded systems design.**
- **Design migration from abstract to concrete.**
- **Formal methods based on partial orders.**
- **Hybrid systems: combining FSM with dataflow.**
- **Modeling and analysis of random systems.**
- **Design of nondeterminate systems.**
- **Complexity management.**
- **Design visualization and documentation.**
- **Partial evaluation and incremental compilation.**
- **Models for back-end signal interpretation.**
- **Heterogeneous scheduling.**

Activities during the Next Year

- **Software infrastructure**
  - Generalize Wormhole mechanism with dynamic switching.
  - Redesign the code generation mechanism for better retargeting.
  - Improve support for scripted runs.
  - Improve design visualization.
  - Generalize type checking and automatic type conversion.
  - Generalize parameter handling.
  - Enhance interactive graphics.
  - On-line design documentation.
  - Simulation data management.
- **Heterogeneous design**
  - Design of a hierarchical finite-state machine controllers
  - Embed controllers designed using Esterel.
  - System-level performance modeling for heterogeneous hardware.
  - Complete the design methodology management domain.

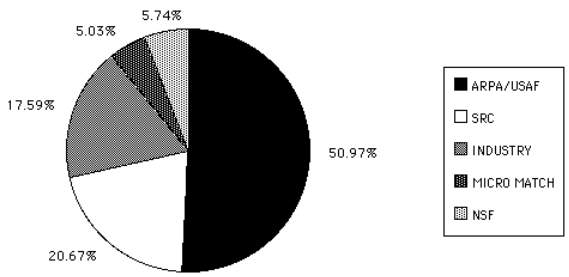
Activities During the Next Year (cont.)

- **Models of computation**
  - Explore interacting semantics of synchronous languages and dataflow.
  - Generalize multidimensional dataflow and explore synthesis issues.
  - Apply Boolean dataflow technology to VHDL-based synthesis.
  - Develop a process network domain that supports nondeterminacy.
  - Add enhancements from the Navy's PGM to the dynamic dataflow domain.
  - Implement and understand cyclo-static dataflow.
- **Applications**
  - InfoPad
  - Radar
  - Image and video processing
  - Communications
- **Algorithm-level design**
  - Interface to Mathematica for symbolic computation.
  - Integrate system rewriting in Mathematica with DMM domain.

1994 Funding for the Ptolemy Project

Industry

- **Bellcore**
- **BNR**
- **Dolby**
- **Hitachi**
- **Mentor**
- **Mitsubishi**
- **NEC**
- **Pacific Bell**
- **Philips**
- **Rockwell**



Institutional Sponsors:

- **ARPA & the US Air Force under RASSP.**
- **the Semiconductor Research Corporation.**
- **the National Science Foundation.**
- **the State of California MICRO program.**

- Cash basis, 1994 only

World Wide Web Server

- Complete distribution of version 0.5.1, including all source code.
- Distribution of Ptiny Ptolemy, a small demonstration version.
- An evolving quick tour of Ptolemy with animations of simple demos.
- *The Almagest*, a four-volume manual for Ptolemy, in PostScript.
- User's manual in hypertext form.
- Publications from the Ptolemy group.
- Keyword searching for publications.
- Directory of project participants and sponsors.
- Copy of the FAQ and info about mailing lists and newsgroups.
